PRODUCT BENEFITS

Sintered stone countertop **

Sintered stone is a high-performance material obtained by a sintering process, where mineral powders such as quartz, feldspar and kaolin are compacted and heated to high temperatures without completely melting. This process creates a dense, homogeneous and resistant surface, ideal for outdoor kitchen countertops.

Benefits of Sintered Stone

Exceptional durability: resistance to weathering and wear.

Stain and water resistance: Waterproof surface, easy to clean.

Thermal and UV resistance: Maintains its stability and appearance over time.

Environmentally friendly: Recyclable material with a reduced carbon footprint.

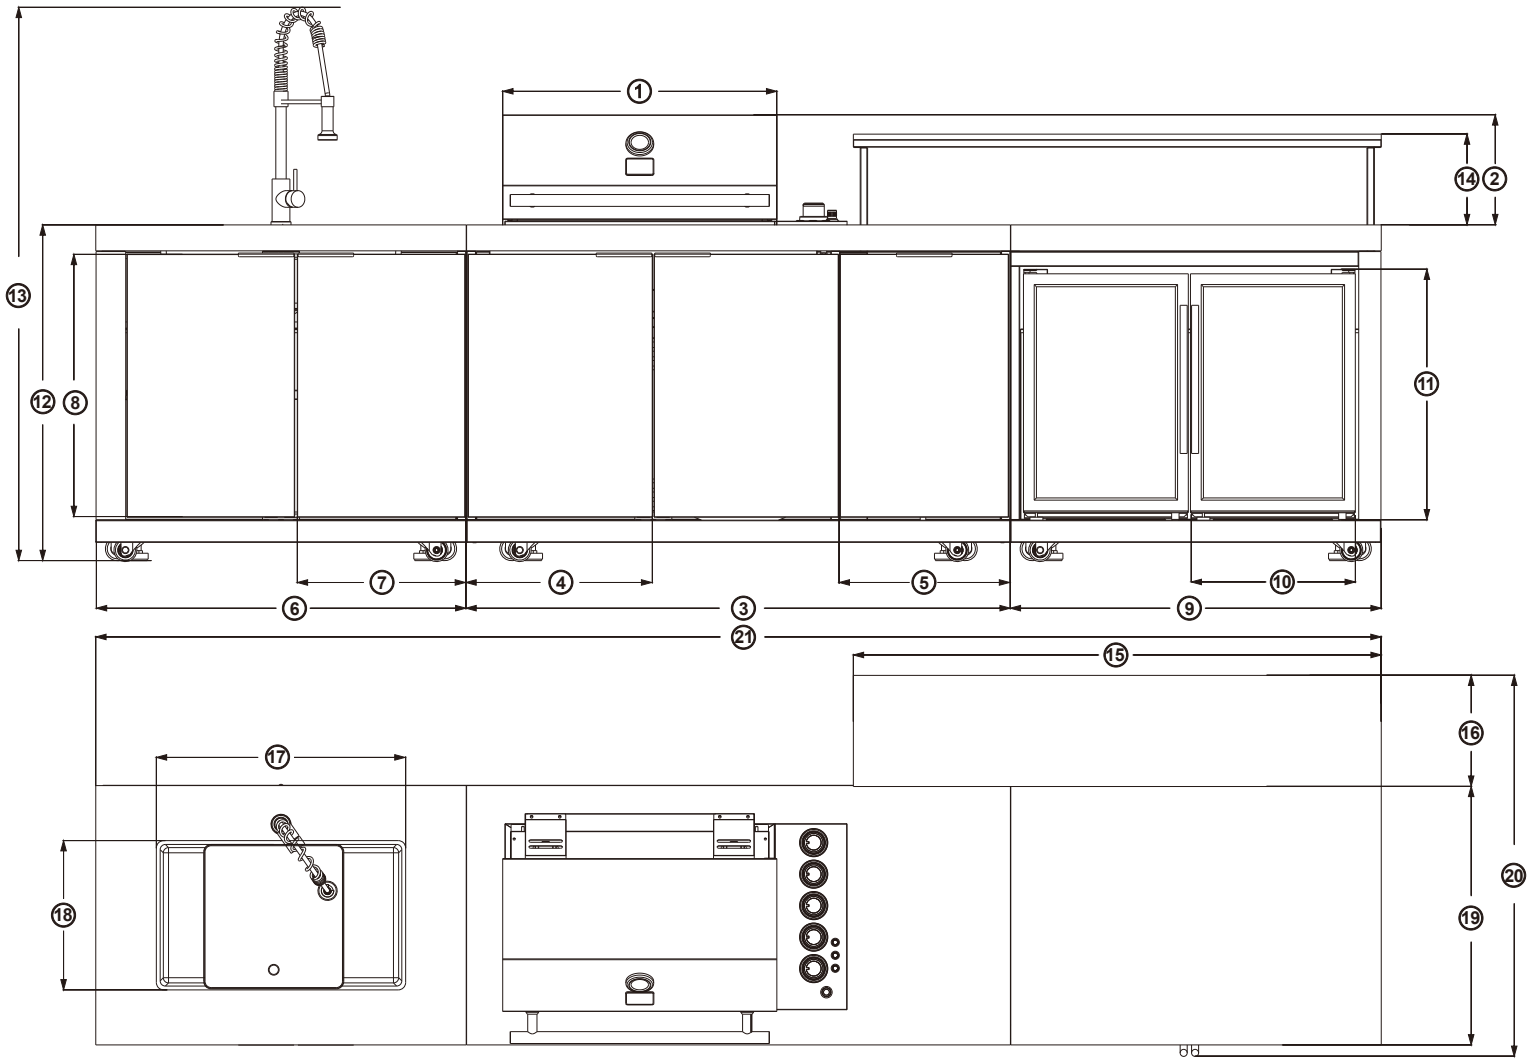

Ease of maintenance: Requires little care thanks to its non-porous surface.

Aluminized steel frame **

Aluminized steel is a material composed of steel coated with an aluminum-silicon alloy, formed by a hot-coating process, then often completed with a powder coating. This unique combination offers the advantages of the strength of steel and the corrosion and heat resistance of aluminum. Powder coating adds extra protection against wear and weathering, enhancing durability and appearance. Thanks to this protection, aluminized steel is particularly suited to applications requiring excellent durability and resistance to oxidation, such as exhaust systems and cooking equipment. What's more, its reflective surface contributes to improved heat dissipation, while guaranteeing long service life and minimal maintenance.
